"The Antivirus Activity of Synthetic Compounds"

Moscow, Veterinariya, No 6, Jun 73, pp 44-46

Abstract: Indolyl-3-propiohydroxamic acid (1), indolyl-3-acetohydroxamic acid (2), 2,4,6-trichlororesorcinol (3), 2,4,6-trichlorophloroglucinol (4), 2,4,6-tribromophloroglucinol (5), N-(o-tolyl)-N-cyanoethylaminobenzoquinone (6), tetrahydrotetraoxonaphthalene dihydrate (oxolin) (7), beta-indolyl-propionic acid (8), and beta-indolylbutyric acid (9) inhibited to 98.4% of more the propagation of the virus of Aujeszky's disease in a cell culture. The prophylactic and therapeutic activities of (1), (2), (3), and (7) and the prophylactic activity of (4), (5), (6), (7), and (8) in connection with the experimental infection of rabbits with the virus were studied. A prophylactic activity was exhibited by (1), (3), and (8): 16.6-40% of the infected rabbits that had been treated with these compounds survived, whereas all of

1/2

USSR

BADAYEV, F. A., et al., Veterinariya, No 6, Jun 73, pp 44-46

the controls died. A slight therapeutic effect was exerted by (2) and (6): the rabbits treated with (2) died 7 days later than controls, while one out of three animals treated with (7) survived. (1), (3), and (8) were also tested in connection with experiments in which sheep were infected with Aujeszky's disease. These compounds had a slight therapeutic effect on the sheep.

"Cytochemical Evaluation of Hog Cholera Virus Vaccine"

MOSCOW, Veterinariya, No 4, 1971, pp 43-45

Abstract: Comparative cytomorphological and cytohistochemical study of immunity production was conducted in gilts immunized with avirulent lapinized and cultural hog cholera virus vaccines (by inhalation and intramuscular injection). The lymph nodes, spleen, liver, lungs, and blood were examined at various times after vaccination. The various changes produced by the vaccines were most pronounced after 4 to 6 days: hyperemia in the lymph nodes, hyperplasia of the lymph follicles, and a sharp plasma cell reaction, especially in the regional lymph nodes and spleen (where the plasma cells increased 3- to 4-fold). The lymphocytes in the peripheral blood showed a similar increase. Biochemical analysis of the blood revealed marked changes in the serum proteins: sharp decrease in albumins and increase in the alpha- and gamma-globulins. All the animals were completely immune to cholera at this time. The cultural vaccine elicited the strongest and most prolonged immunomorphological response and conferred the highest degree of immunity.

"Solution of the Pelegrin Problem for Objects With Delay in the Case of Uncorrelated Input Signals"

Tr. NII upravl. mashin i sistem (Works of the Scientific Research Institute for Control Computers and Systems), 1971, vyp. 5, pp 127-131 (from RZh-Kibernetika, No 9, Sep 71, Abstract No 9V306)

Translation: The Pelegrin problem in the statistical dynamics of automatic systems is the name given to the generalization of the Wiener problem to systems with a predetermined invariable section when, in addition to the useful signal with superimposed interference, the system is subjected to other disturbances whose point of application does not coincide with that of the useful signal. In this paper, methods of optimizing multidimensional systems are used to find a general solution with regard to the limitations which are imposed by delay in the given section of the system. From the author's résumé.

A70-28184 # A device for transmitting analog signals
(Ustroistvo dlia peredachi analogovykh signalov). V. K. Arkhipov, M.
V. Gaifullin, Iu. N. Kruglov, and V. G. Shatokhin. *Pribory i Tekhnika
Eksperimenta*, Jan.-Feb. 1970, p. 195-197. In Russian.

Description of a device for transmitting information in analog form, using He-Ne laser radiation to attain a time resolution of 9 nsec. A detailed study is made of the transfer characteristics of an optical telemetric channel for transmitting pulsed nanosecond signals in analog form. It is shown that, if the light intensity at the modulator output at the initial operating point amounts to 12 to 17% of the maximum and the operating conditions of the photodetector are correctly chosen, a pulse with an amplitude of up to 300 V can be transmitted through the telemetric channel with minimum nonlinear distortions. It is noted that the wideband feature of the transmission line in such a system is determined mainly by the time resolution of the photomultiplier.

"Cadence Synchronization of a Multichannel Pilot Communications System"

Moscow, Radiotekhnika, Vol. 26, No 6, Jun 71, pp 7-13

Abstract: A method of cadence synchronization of a system of communications with phase telegraphy is considered. To eliminate phase ambiguity, unkeyed pilot signals are introduced into the group signal. Between the pilot signals are $m-1$ information components with frequency spacing w_p of the order of a few dozen Hz (where m is a positive whole number). This close spacing ensures fairly strong correlation between the random phase components of the carriers of partial channels and the closest pilot signal, which makes it possible to compensate for the nonstationary nature of the short-wave channel. The synchronizing method boils down to comparing the positions of the vectors of the group spectrum components in system of coordinates which are fixed relative to determined components of the above-mentioned vectors. The systems of coordinates are formed by vectors corresponding to the sine and cosine components of reference voltages generated by the frequency-changing circuit at the reception end. If the receiving and transmitting frequency changers are mismatched

1/2

ARKHIPOV, V. S., Radiotekhnika, Vol. 26, No 6, Jun 71, pp 7-13

by Δt , then the positions of the above-mentioned vectors in the corresponding systems of coordinates will not coincide. The difference in the angles of turn of the vectors in the corresponding systems will be proportional to Δt . A diagram of the device is presented, and the sign of the mismatch is determined. Coarse and fine adjustment circuits are provided in the cadence synchronization system.

"Atomic Correlation in Invar Ferro-Nickel Alloys"

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 34, No 2, Aug 72, pp 309-
315

Abstract: An experimental investigation was made of the nuclear diffusion scattering of neutrons on hardened specimens of ferro-nickel alloys (50, 65, and 70 at% Fe). The specimens contained the isotope of nickel 62 having a negative amplitude of scattering. The parameters of the short-range order ($a < 0$) in the first and the second coordination spheres were calculated by the method of least squares from experimental curves of the dependence of the differential scattering section on the wave vector. The calculation of the number of atoms in the first coordination sphere indicates that in hardened nickel alloys containing 65 and 70 at% Fe, a short-range order of the NiFe or NiFe_3 types is being established. A parallel investigation was made of the change of the linear expansion coefficient and parameters of the short-range order depending on the annealing temperature of the Invar alloy. The experiments revealed that temperature annealing, reducing to a development

1/2

USSR

MEN'SHIKOV, A. Z., et al., Fizika Metallov i Metallovedeniye, Vol 34, No 2, Aug 72, pp 309-315

of a short-range order, decreases the anomaly of the linear expansion coefficient. Therefore, the atomic correlation of the short-range-order type can only attenuate the Invar phenomenon, but it cannot be its source. Two figures, one table, fifteen bibliographic references.

ORGANIZATION AND PERFORMANCE OF COMPOSITE PHYSICAL EXAMINATIONS IN THE
RURAL POPULATION OF TAKROVSKAYA OBLAST'

[Article by N. A. Arshbaeva, G. V. Remezovskiy, Chair of Social Medicine and
Public Health Organization, Head of Post-Graduate A.P.T. Services, corresponding
member of the USSR Academy of Medical Sciences, First Vice-President
Institute of Social Medicine, Moscow; N. M. Slobodchikov, Researcher,
Russian, No. 10, 1972, submitted 3 March 1972, pp. 22-25]

In the current literature it is customary to equate organization and performance of composite physical examinations in the rural population with the organization of medical examination of the rural population. At the same time, it is very important, particularly for specialists in social hygiene, for the knowledge pertaining to organization of investigations to be the subject of discussion and even of special study.

In the present report we summarize the concrete experience gained in organizing and performing mass physicals on the rural population of Tambovskaya Oblast' which were a component of the program of a scientific-technological study.

The study was conducted in 1970-1971 by the chair and local public health institutions. It was based on a specially developed method* which defined the objectives, tasks, and objects of investigation. In particular, a 9,000 person sample of the rural population from two towns or the oblast' (Strelchinsk and Sosnogorsk) served as the object for investigation of the physical condition of the rural population. In accordance with the objectives and tasks of the study a "Circular of medical and social survey of the rural population" was developed which is consistent with the procedure of both a family and individual survey. The organizational principles of our work were based on: 1) aid of local Party and Soviet organizations; 2) utilization of the existing network of public health agencies and institutions; 3) active involvement of public organizations and the broad community in the study.

*Method for Organizing and Performing Composite Physical Examinations in the Rural Population of Sosnogorsk Tambovskaya Oblast' (Method of Complex Sociodemographic Investigation of the Physical Condition of the Population of Tambovskaya Oblast'), Moscow, 1970.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE CONFORMATIONS OF THE MOLECULES WITH THREE AMIDE GROUPS: N,ACETYLGLYCYLGLYCINE, N,ACETYL,L (D) ALANYL,L,ALANINE AND N,ACETYL,L,VALYL,L,VALINE HAVE BEEN INVESTIGATED. THE GEOMETRICAL PARAMETERS OF FAVORABLE FORMS WITHOUT HYDROGEN BONDING HAVE BEEN CALCULATED USING THE MINIMIZATION PROCEDURE AND DEPICTED ON THE TWO DIMENSIONAL PHI (C PRIMEALPHA MINUS N) MINUS PSI (C PRIMEALPHA MINUS C PRIME) CONFORMATIONAL MAPS. THE VALUES OF THE PHI AND PSI ANGLES IN THE PREFERRED CONFORMATIONS OF CORRESPONDING COMPOUNDS WITH TWO AMINO GROUPS CAN BE USED AS THE ZERO APPROXIMATION IN THE SEARCH FOR THE POTENTIAL ENERGY MINIMUM OF THE OLIGOPEPTIDES. THE SIGNIFICANT SCATTERING IN THE PHI AND PSI VALUES FOUND FOR THE METHYLAMIDES OF N ACETYLDIPEPTIDES AS WELL AS THE DEVIATIONS FROM ADDITIVITY OF ENERGIES ARISING WITH INCREASE OF PEPTIDE CHAIN LENGTH CAN BE CONSIDERED AS THE EVIDENCE FOR MUTUAL DEPENDENCE OF CONFORMATIONAL STATE OF THE TWO AMINO ACID RESIDUES. THE MOST STABLE AMONG THE STRETCHED FORMS INVESTIGATED ARE THOSE THAT HAVE THE ANGLES OF ROTATION ABOUT THE C PRIMEALPHA MINUS N AND C PRIMEALPHA C PRIME BONDS CLOSE TO THOSE OCCURRING IN THE RIGHT HANDED ALPHA HELIX AND IN THE BETA STRUCTURE. THE EFFECT OF DISTURBANCES OF THE STEREOREGULARITY OF THE ASYMMETRIC CENTERS IN THE PEPTIDE CHAIN ARE ALSO DISCUSSED. FACILITY: INSTITUTE FOR CHEMISTRY OF NATURAL PRODUCTS, ACADEMY OF SCIENCES, USSR, MOSCOW.

"Conversion and Processing of Information. Collection of Articles"

Preobrazovaniye i Obrabotka Informatsii. Sb. Statey [English Version Above],
Moscow, Moscow University Press, 1972, 191 pages (Translated from Referativnyy
Zhurnal Kibernetika, No 4, 1973, Abstract No 4V642).

Translation: This collection contains a number of articles in three sections: "Programming," "Conversion of Information" and "Processing of Information." The first section of the collection includes articles on programming of statistical problems, editing programs, programs for printer output of graphic and symbolic information, etc. The articles in the second section are dedicated to pressing problems of conversion of information in various computer input-output devices, measuring and control systems. The third section of the collection contains articles which analyze general problems of information processing using correlation devices and conversion devices, test systems, as well as individual circuits of computer input-output devices, automatic computers, computing, measurement and control systems.

"Design Methods of Improving the Dynamic Precision of Servo-Type Analog-Digital Converters"

Taganrog, Region. nauch.-tekhn. seminar po stat. analizu, modelir. i avtomatiz. kontrolya ob"yektor s konstrukt. slozhn. strukturoy--sbornik (Regional Scientific and Technical Seminar on Statistical Analysis, Modeling and Automated Monitoring of Objects With a Structurally Complex Design--collection of works), vyp. 6, 1972, pp 25-29 (from RZh-Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No 11, Nov 72, abstract No 11B304)

Translation: The author considers methods of correcting servo-type analog-digital converters with respect to speed. The base circuit is selected, an optimum equivalent circuit is synthesized and the defining equation is derived, a table of parameters is computed for different states of the system, and the laws are found which govern the mutual relation between the parameters of the system and its state. The synthesis of the structures contains a check on all possible hypotheses of different functioning of correction systems with determination of the main output characteristics. The results of modeling are given. Five illustrations, bibliography of two titles. L.P.

"Signal-Brightness Converter of Image Display Device"

Novyye Beskontaktn. Elektron. Ustroystva. Ch. 2 [New Contactless Electronic Devices. Part II -- Collection of Works], Moscow, 1970, pp 210-212 (Translated from Referativnyy Zhurnal Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No 10, 1970, Abstract No 10B262, by T. R.)

Translation: It is noted that when various problems are solved by digital computer, complex functional relationships of three variables must be displayed. These problems include the following: cross section of a heterogeneous body, graphs of distributions as functions of a new parameter (for example, time or temperature), nonlinear surfaces, etc. In these cases, scanning by cross sections or multiple imposition of images (cone-image type) are ineffective. The most successful method is the brightness-modulation method. In the transmission of data from the computer to the "modulator," the cathode ray tube of the device contains two units: a digital-analog converter and an interrupter-modulator. The principal requirements on these units are determined. Three illustrations.

"Variational Problem With Functions of Several Variables and Operator
Limitations: Principle of the Maximum and Theorem of Existence"

Moscow, DAN SSSR, 1971, vol 200, No 1, Sep 71, pp 9-12

Abstract: The following variational problem is considered. It is required
to maximize the functional

$$\Phi(\bar{u}) = \int_0^1 \int_0^1 c(x, y, u(x, y)) dx dy$$

assuming the limitations

$$\int_0^1 f(x, y, u(x, y)) dy = 0;$$

1/2

USSR

ARKIN, V. I., LEVIN, V. L., DAN SSSR, vol 200, No 1, Sep 71, pp 9-12

$$\int_0^1 g(x, y, u(x, y)) dx = 0;$$

the mapping $\bar{u} = u(x, y) : K \rightarrow U$ is measurable and

$$u(x, y) \in U(x, y)$$

for nearly all $(x, y) \in K$ where $K = \{(x, y) : 0 \leq x \leq 1, 0 \leq y \leq 1\}$, U is a complete, separable metric space. A necessary and sufficient condition of optimality is established in the form of the principle of the maximum, and a theorem of existence of the extremum is formulated. Bibliography of nine titles.

- 112496j Structure and molecular motion in blended polymers studied by a paramagnetic probe method. Kovarskii, A. L.; Arkina, S. N.; Vasserman, A. M. (Inst. Khim. Fiz., Moscow, USSR). *Vysokomol. Soedin.*, Ser. B 1970, 12(1), 38-41 (Russ.).

The addn. of triethylene glycol dimethacrylate (I) and cumene peroxide to butadiene-acrylonitrile rubber (II) and heating to achieve ~85% polymn. of I reduces the rotational mol. motion of II due to the formation of the crosslinked polymethacrylate structure. The degree of the mol. motion decrease was detd. by measuring the decrease of the rotational periods (τ) of 2,2,6,6-tetramethylpiperidinoxy or of its 4-hydroxy- or 4-oxo-derivs., added to II, by the paramagnetic probe method (A. M. Vasserman, et al., 1967, 1968, 1969). The decrease of τ to 10^{-7} sec corresponding to "frozen" free radicals was not uniform at various II sample locations, indicating nonhomogeneity regions. ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. COMPARISON OF THE MAIN FEATURES OF A HIGH FREQUENCY INSTABILITY OBSERVED IN THE COMBUSTION CHAMBERS OF LIQUID ROCKET ENGINES WITH THE FEATURES OF A SPIN DETONATION. IT IS SHOWN THAT THE CONDITIONS CREATED NEAR THE ATOMIZERS OF A LIQUID ROCKET ENGINE ARE THE SAME AS THOSE OCCURRING BEHIND THE LEADING EDGE IN A SPIN DETONATION. IT IS CONCLUDED THAT THE OBSERVED HIGH FREQUENCY INSTABILITY IS A SPIN DETONATION UNDER THE SPECIFIC CONDITIONS OF A LIQUID ROCKET ENGINE COMBUSTION CHAMBER. METHODS OF PREVENTING THIS INSTABILITY FROM OCCURRING ARE CONSIDERED.

"Creep of IVT-1, a β -Alloy of Titanium"

Moscow, IAN SSSR, Metally, No 2, Mar-Apr 71, pp 163-167

Abstract: The creep of IVT-1, a β -alloy of titanium (7% Mo, 5.5% Cr, 3% Fe, 3% Al, remainder Ti) was determined at temperatures of 100, 200, 250, and 350°C at stresses of 120, 115, 110, 90, 80, and 75 kg/mm² over 1,000 hours and in some cases up to 2,500 hours. The limiting stress causing 0.02% residual deformation of the alloy after 1,000 hours is 105 kg/mm² at 200°C and 79 kg/mm² at 250°C. The rate of stable creep at these stresses and temperatures is $2 \cdot 10^{-5}\%$ /hr. The creep tests showed that if two specimens tested under identical conditions show different initial deformation, the specimen with greater initial deformation generally has lower creep than the specimen with less initial deformation. Total deformation increases little with increasing load time at 100-250°C and 120-75 kg/mm². Following creep tests, some breakup of β phase grains is observed; migration of grain boundaries and displacement along grain axes (slipping) were noted.

"Morphological Changes and Disturbances in the Physiological Functions Induced in the Rabbit's Organ of Equilibrium by the Action of Ionizing Radiation"

Moscow, Radiobiologiya, Vol 11, No 4, Jul/Aug 71, pp 560-565

Abstract: Rabbits were irradiated with gamma-rays in a dose of 800 r at a dose rate of 500 r min. The most pronounced disturbances of functions of the vestibular analyser developed within the first hours after irradiation. During this time compression of the membranous labyrinth took place as a result of disturbed lymph circulation. Because of this compression, crypts connecting the membranous with the osseous labyrinth were torn apart together with the blood vessels passing through them. Subsequently dystrophic changes took place in the inner ear, leading finally to necrosis of the sensory and secretory epithelium. Within the first hours after the action of radiation, there were pronounced changes in the labyrinth function, which were indicated by a lowering of the intensity of the nystagmus reaction in response to stop stimuli and a reduced sensitivity to position changes. In later stages of the
1/2

radiation injury, the degree to which the functions of the vestibular analyisor were impaired did not correspond to the morphological changes in the inner ear, because compensatory mechanisms of the central nervous system came into play.

"A Ladder-Type Electromechanical Band Filter"

USSR Author's Certificate No 266099, filed 16 Sep 64, published 28 Jul 70
(from RZh-Radiotekhnika, No 1, Jan 71, Abstract No 1V344 P)

Translation: This Author's Certificate introduces an electromechanical ladder-type band filter for torsional vibrations with resonators and ferrite converters arranged in parallel and connected by wires. The resonators are made from half dumbbells fastened on a plate of rectangular cross section with high wave impedance. The resonators are fastened to a common base by means of rods with low wave impedance as compared with that of the resonator at the point where the rod is connected.

"New Isotopes ^{176}Os and ^{177}Os and Information on the Decay of Isotopes $^{177-180}\text{Re}$ and $^{178-180}\text{Os}$ and on the Decay Scheme of ^{179}Re "

Moscow, Izvestiya Akademii Nauk SSSR: Seriya Fizicheskaya; April, 1970; pp 702-12

ABSTRACT: Isotopes of osmium were obtained by irradiating metallic gold and mercuric oxide in an external beam of protons with an energy of 660 Mev of the synchrocyclotron of the Joint Institute for Nuclear Research; rhenium isotopes were obtained as daughter isobars of osmium.

The half-lives of the light isotopes of osmium: ^{176}Os (3.0 min), ^{177}Os (3.5 min), ^{178}Os (6.0 min), ^{179}Os (7.3 min), ^{180}Os (22.0 min), and ^{181}Os (110 and 2.7 min), were determined.

The new isotopes ^{176}Os and ^{177}Os were identified on the basis of a genetic bond with daughter isobars of tungsten and tantalum.

A rhenium decay scheme is suggested which is based on data obtained from this work on gamma radiation of ^{179}Re and on well-known data on conversion electrons.

"Analysis of the Phase Composition of Aluminate Cakes and Slurry by the Chemical Method"

Tr. Vses. n.-i. i proyektn. in-ta alyumin., magn. i elektrodn. prom-sti (Works of the All-Union Scientific Research and Planning and Design Institute of Aluminum, Magnesium and Electrode Industry), 1970, No 70, pp 43-50 (from RZh-Metallurgiya, No 4, Apr 71, Abstract No 4G126)

Translation: On the basis of investigation of the solubility of compounds contained in the cakes and slurries of alumina production, a procedure is proposed for successive leaching out of them in alkaline and acid solutions for quantitative phase analysis. The correspondence of the analysis results by the given procedure and also the results from x-ray micrography and crystal-optical methods is demonstrated. The basic causes of incompleteness of extraction of the Al_2O_3 and Na_2O from the cakes is the formation of Ca-aluminates and Na-Ca-silicates during the sintering process and also the occurrence of secondary reactions when leaching out the crushed cake leading to the formation of hydrogranates and tricalcium hydroaluminate. 1 illustration and 5 tables.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. LETHALITY AND MITOTIC RECOMBINATION INDUCED BY UV, GAMMA RAYS, NITROUS ACID, AND NITROSOGUANIDINE (I) HAVE BEEN STUDIED IN UV SENSITIVE DIPLOID S. CEREVISIAE. THE SUPERSENSITIVE STRAIN PG-61 AND WILD TYPE PG-60 DEMONSTRATED APPROX. EQUAL RESISTANCE TO THE LETHAL EFFECT OF IONIZING RADIATION AND NITROSOGUANIDINE. AFTER 20 AND 40 MIN. EXPOSURES TO NITROUS ACID, THE SURVIVAL RATE OF THE SENSITIVE STRAIN WAS APPROX. 1.5 TIMES LOWER THAN THAT OF WILD TYPE. IN EXPTS. WITH UV, THESE STRAINS SHOWED A 25-28 FOLD DIFFERENCE IN SURVIVAL RATE. IT IS CONCLUDED THAT THE UN MUTATION AFFECTS REPAIR ONLY OF UV DAMAGE, I.E., PHOTOPRODUCTS OF THE DNA PYRIMIDINE DIMER TYPE. DARK REPAIR OF LETHAL DAMAGE CAUSED BY OTHER AGENTS (GAMMA RAYS, I) OCCUR NORMALLY, WITH THE EXCEPTION OF A SMALL PART OF THE DAMAGE INDUCED BY NITROUS ACID. NO DIFFERENCE IN THE FREQUENCY OF RECOMBINANTS INDUCED BY NITROUS ACID WAS SLIGHTLY HIGHER THAN THAT OF WILD TYPE. IT IS CONCLUDED THAT THERE IS A CORRELATION BETWEEN SENSITIVITY TO THE LETHAL EFFECT AND FREQUENCY OF INDUCED RECOMBINANTS, IN AGREEMENT WITH THE PREMISE THAT RECOMBINATION IS A RESULT OF DNA DAMAGE. THE FREQUENCY OF RECOMBINATION IN WILD TYPE CELLS WAS HIGHEST WHEN INDUCED BY GAMMA RAYS, SLIGHTLY LOWER WITH UV AND NITROUS ACID, AND LOWEST WITH I.

"Transistor Cascode Amplifier of the Common Emitter - Common Collector Type for the Middle Frequencies"

Moscow, Izmeritel'naya Tekhnika, No 7, 1970, pp 57-59

Abstract: Cascode amplifiers, which have recently been receiving a good deal of attention in connection with measurement technique and electrical automatic systems, are very promising for use as variable voltage amplifiers in the middle frequencies when connected in the common emitter and common collector configuration. The article shows that an amplifier of this type has a gain one to two orders higher than the ordinary amplifier with common emitter in practical circuits with a reduction in the output resistance. The basic cascode circuit and its equivalent are given including an analysis of the equivalent circuit. Possible values of circuit components for practical cases are given.

AN0045467

Our institute has three -- in Murmansk, Apatity and Loparskaya. The various types of equipment at the stations include an automatic all-sky camera. This camera takes one photograph per minute. A wide-angle optical system permits it to photograph the entire sky at once. In the coming years we intend to conduct a complex and extensive study of auroras. Aircraft, balloons and the most modern equipment will assist us.

Our laboratory has been conducting regular observations for more than 10 years. A large volume of scientific material has been collected in this time. We follow the work of our foreign colleagues with great interest and exchange various types of information with them. In the future we intend to carry out a number of joint projects within the framework of Soviet-French scientific cooperation. [4]

Polar Geophysical Institute Will Lead Aurora Studies

APPROVED FOR RELEASE: 08/09/2001 CIA-RDP86-00513R002200210017-6"

(Excerpts: "Toward the Secrets of Nature," by R. Armeyev; Moscow, Izvestiya, 7 February 1970, p. 6)

[Following is an interview by correspondent R. Armeyev with Leonid Sergeyevich Yevlashin, head of the aurora laboratory of the Polar Geophysical Institute, Kola Affiliate of the Academy of Sciences USSR.]

The Polar Geophysical Institute of the Kola Affiliate of the Academy of Sciences USSR henceforth will be the leading institute in the photographic observation of auroras. Our task will be the thorough investigation of auroras for the purpose of studying the physics of the upper layers of the atmosphere (ionosphere), situated approximately 100 kilometers from the earth. It is here that auroras are formed. Their study will enable us to learn more of the properties of interplanetary space -- the magnetosphere. Here the distances are greater -- six to eight earth radii.

In our investigations we use optical observations, or photometry. There are observation stations in the auroral zone throughout the world.

V sb. Nauch.-tekhn. konf. po probl. Razrab. mer zashchity met. ot korrozii, 1971. Tezisy dokl. vyp. 2. Sekts. 4-5 (Scientific and Technical Conference on the Problems of the Development of Measures for Protection of Metals from Corrosion. 1971. Topics of Reports. Vyp. 2. Sections 4-5 -- collection of works), Moscow, 1971, pp 101-104 (from RZh-Khimiya, No 6 (II), Jun 72, Abstract No 6L300).

Translation: It was established that the magnitude of the coercive force (H_c) of Co deposits depends both on the orientation of the α -Co crystals and on the amount of β -phase of the Co in the deposit. For the orientation of the α -Co [0001] H_c and the rectangularity of the hysteresis loop decreased with an increase in imperfection of the texture since in this case the axis of easy magnetization lay perpendicular to the plane of the plate. With a texture [1120] of α -Co and [110] of β -Co respectively, H_c increased with a decrease in the amount of Co phase since the magnetic anisotropy constant of α -Co is higher than that of β -Co.

"Use of the ALCEM-ST3 System of Programming Automation for Operation With List Quantities"

V sb. Tsifr. vychisl. tekhnika i programmir. (Digital Computer Technology and Programming--collection of works), vyp. 6, Moscow, "Sov. radio", 1971, pp 83-87 (from RZh-Kibernetika, No 7, Jul 71, Abstract No 7V736)

Translation: The paper considers a method of working with list quantities by using the ALCEM-ST3 system of programming automation. A method is demonstrated for construction of chain lists in the form of data blocks under which the indices of elements of the blocks are used as communications addresses. The aggregate of associative units is represented in the form of two composite data blocks: a block of headings of units and a block of list words. The method is experimentally checked out on the "Minsk-22" computer. Author's abstract.

"Concerning a Numerical Method in the Nonlinear Theory of Thin-Walled Elastic Shells"

Tr. Ul'yanovsk. politekhn. in-ta (Works of the Ul'yanovsk Polytechnical Institute), 1972, 8, No 2, pp 191-202 (from RZh-Mekhanika, No 9, Sep 72, Abstract No 9V73)

Translation: It is proposed that Newton's iteration process be used to solve nonlinear equations of equilibrium of shells of revolution which can not be considered flat, and whose stressed state is described by modified Reissner equations (E. L. Aksel'rad, Izv. AN SSSR. Otd. tekhn. n. Mekhan. i mashinostr., 1960, No 4, pp 84-92 -- RZhMekh 1961, 6V41). The effectiveness of this method is evaluated on the example of solution of a system of nonlinear equations for a flat diaphragm. As a result of intercomparison of initial approximations and the behavior of discrepancies in differential operators, it is concluded that the given iteration process converges satisfactorily. L. A. Shapovalov.

"A Parametric Converter Which Changes Impedance, Capacitance and Inductance to a Frequency-Modulated Signal"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tovarnyye Znaki, No 17, Jun 72, Author's Certificate No 340080, Division H, filed 16 Jun 69, published 24 May 72, p 192

Translation: This Author's Certificate introduces a parametric converter which changes impedance, capacitance and inductance to a frequency-modulated signal. The device contains an adder connected at the output to the input of an amplifier with inertial nonlinear feedback. The output of the amplifier is connected to a measurement circuit made in the form of resistive and reactive elements connected in series. The tiepoint between the resistive and reactive elements is connected to the inputs of a phase inverter and an integrating link, which is connected to the adder input. As a distinguishing feature of the patent, the range is extended and measurement accuracy is improved by adding a differentiating link connected between the adder and the phase inverter.

Moscow, Otkrytiya, izobreteniya, promyshlennyye obraztsy, tovarnyye znaki,
No 4, Feb 71, Author's Certificate No 292174, Division G, filed 23 Sep 69,
published 6 Jan 71, p 134

Translation: This Author's Certificate introduces a converter for changing a pickup parameter to a phase-modulated signal. The unit contains a sinusoidal reference voltage oscillator, a measurement bridge, a phase shifter and a linear adder. As a distinguishing feature of the patent, the device is designed to suppress parasitic amplitude modulation, to extend the range of phase deviation, and to improve the linearity of the modulation characteristic. The unit contains an additional linear adder with two inputs, and an amplifier connected between the output of the additional adder and the diagonal of the bridge. Both adders are connected by one of their inputs to the reference voltage oscillator, and by the other to the output of the phase shifter. The input of the phase shifter is connected to the measurement diagonal of the bridge.

"Lectures on Bifurcations and Versal Families"

Moscow, Uspekhi Matematicheskikh Nauk, Vol 28, No 5(167), Sep/Oct 72, pp
119-184

Abstract: These lectures deal with replotting the arrangement of phase curves of a vector field close to a singular point when there is a change in the parameters on which the vector field depends. A convenient technical means for studying such arrangements is to use deformations of the vector field which have a special property of universality -- so-called versal families. The results of the study are presented chiefly in the form of explicit expressions for versal families and analysis of the corresponding bifurcation diagrams. Applications of the general theory are illustrated by classifying the specifics of the decrement of general two-parameter families of linear autonomous systems, and classifying the singularities of the neutral surface (stability boundary) in general three-parameter families of linear systems; topologically versal deformations of singular points of nonlinear systems of ordinary equations are presented for all cases of de-

"Realization of the Trigger Effect in Magnetic Films in the Presence of Constant Magnetic Fields"

Tomsk, Izvestiya Vysshikh Uchebnykh Zavedeniy, Fizika, No 3, 1972, pp 105-107

Abstract: Experiments to study the effect of constant magnetic fields applied along the easy magnetization and difficult magnetization axes on achievement of a trigger effect and on the final magnetization states after the action of a pulsed field along the difficult magnetization axis are described. These experiments show the possibility of controlling the trigger effect and the possibility of applying controlling pulses of short duration in magnetic film memory units. The experiments also provide some information on certain features of the motion of the magnetic moment under the action of a pulsed field H_p and also information on inertia. Experiments are conducted on films obtained by thermal evaporation of an 81.5% Fe alloy in a vacuum. The film thickness was 750 Å. The film had an anisotropy field $H_k = 2.9$ oe, a coercive force $H_c = 1.6$ oe, and an angular dispersion $\alpha_{90} = 1.3^\circ$. It is shown that under weak pulsed fields the constant fields directed opposite to the pulse

1/1

USSR

RODICHÉV, G. M., ARNOL'D, O. P., Izvestiya Vysshikh Uchebnykh Zavedeniy, Fizika, No 3, 1972, pp 105-107

impede the achievement of a trigger effect and that under strong pulsed fields the same field constants facilitate the achievement of a trigger effect. In the latter case the range of pulses leading to a trigger effect increases. Under the action of small pulsed fields the constant field makes conditions for achievement of a trigger effect poorer, since the rotating moment acting on the magnetization decreases. Under strong pulsed fields the decrease in the rotating moment due to the constant field does not have any considerable value, but the time in which the rotating moment reaches its greatest value increases due to the fact that the magnetic moment in the initial state is somewhat deflected opposite to the direction of the pulsed field.

"Placement of Ovals of Real, Plane Algebraic Curves, Involutions of Quadrilateral Smooth Manifolds, and the Arithmetic of Integral Quadratic Forms"

Moscow, Funktional'nyy Analiz i yego Prilozheniya, Vol 5, No 3, 1971,
pp 1-9

Abstract: The purpose of this article is to show how the connection between the placement of the sections of a real algebraic curve on the projective plane, on the one hand, and the topology of some complex algebraic surfaces, on the other, can be put to use. The author finds that it can be used to derive information concerning the placement of the ovals of real, planar algebraic curves from simple considerations of four-dimensional topology and the arithmetic of integral quadratic forms. He considers a real algebraic curve of degree n on a projective plane RP^2 , the curve being a compact, smooth, unidimensional, boundless manifold whose components of connectivity, diffeomorphic with respect to a circle, are known as ovals. The assumption is made that the curve is of even degree, in which case the ovals lie in RP^2 . Each of them will have an inside part, diffeomorphic to a circle, and an outside part, diffeomorphic to a Möbius sheet. The author

"Modes and Quasimodes"

Moscow, Funktsional'nyy Analiz i yego Primeneniya, Vol 6, No 2, Apr-Jun
72, pp 12-20

Abstract: Attention is called to the fact that quasiclassical concepts of the form of high-frequency natural oscillations of bounded regions contradict general considerations of symmetry based on a study of stratification of a set of ellipsoids in accordance with different symmetry groups. These considerations are applicable to oscillatory systems with a finite and an infinite number of degrees of freedom and, in general, to all problems in which quadratic parameter-dependent forms are encountered. This dilemma is resolved by showing that functions derived within the quasiclassical framework are not modes (eigenfunctions) or even close to any modes but are rather merely quasimodes: under the initial conditions established by such functions, oscillations will eventually resemble standing waves. It is pointed out that this situation does not obviate the usefulness of quasiclassical approximations to eigenvalues. The author thanks M. A. Isakovich, A. I. Shnirel'man, L. D. Faddeev, A. M. Veselova, and S. P. Novikov for constructive criticism. Bibliography of nine titles.

"Matrices Depending on Parameters"

Moscow, Uspekhi Matematicheskikh Nauk, vol. 26, No. 2, March-April 1971, pp 101-114

Abstract: This paper offers a solution to the problem of finding a simple normal form to which a particular matrix or any similar family of matrices can be reduced, by using some transformation which is a continuous function of the matrix elements. The solution is found for a family of matrices which are holomorphically dependent on the parameters. Prompting the need for such a solution is the fact that the reduction of a matrix to the Jordan normal form is an uncertain procedure and that, in analyzing a family of matrices, an attempt to reduce them to the Jordan form results in a loss of their continuity with respect to the parameters. Dedicating his paper to Ivan Georgiyevich Petrovskiy, on the occasion of his 70th birthday, the author expresses his thanks to N. N. Brushlinskiy, D. A. Kazhdan, and S. G. Kreyn for their advice.

"On Local Problems in Analysis"

Moscow, Vestnik Moskovskogo Universiteta, No 2, 1970, pp 52-56

Abstract: Several natural questions that arise in studying problems of the local behavior of different analytical objects are pointed out. Three examples of analytical objects are given: 1. A real function f analytical in the neighborhood of the point R^n . 2. A system of differential equations

$$\dot{x} = v(x), \quad (1)$$

defined by a vector field analytical in the neighborhood of point O . 3. An analytical mapping F of the neighborhood of point O into the neighborhood of point O . The following three examples of local problems are given: 1. Does the function f at the point O have a local minimum? 2. Is the equilibrium position O of system (1) (or the fixed point O of the reflection F) stable in the Lyapunov sense or asymptotically? 3. Are the two given systems (1) and

$$\dot{x} = u(x) \quad (2)$$

equivalent topologically in the neighborhood of the equilibrium position O ?

A problem is defined as the partition of a space of increments of functions analytical in 0 into a certain number of classes. A formal definition of a trivial problem is set up and the sample problems are tested for whether they are trivial. The following is given as a sample of a nontrivial problem: the topological classification of phase curves of system (1) in the neighborhood of the equilibrium position 0 in complex space C^n , $n \geq 2$.

"Topological Invariants of Algebraic Functions. II"

Moscow, Funktsional'nyy Analiz i Yego Prilozheniya, Vol 4, No 2, Apr/Jun 70,
pp 1-9

Abstract: The cohomology of groups of braids is used to prove the nonrepresentability of algebraic functions of several variables by superpositions of algebraic functions of a smaller number of variables. A previous article with the same title (Trudy Moskogo Matematicheskogo Obshchestva, Vol 21, 1970, pp 28-43) used the relationship between algebraic functions and braids to calculate the cohomologies of groups of braids. The reason for the nonrepresentability is shown to be topological: classes of cohomologies of the complement to the manifold of the branching of the function induced by classes of cohomologies of groups of braids prevent the representation of the function in the form of a superposition. The following theorem is proved. An algebraic function of k variables a_1, \dots, a_k

$$z^n + a_1 z^{n-2} + a_2 z^{n-3} + \dots + a_k = 0 \quad (k = n - 1)$$

cannot be represented in the form of a superposition of algebraic functions with the number of variables smaller than k if $n = 2^r$, $r \geq 2$. In particular, the root of the fourth degree polynomial considered as a function of the coefficients cannot be represented in the form of a superposition of algebraic functions of two variables. The definition of superposition is discussed.

"Classification of Unimodal Critical Points of Functions"

Moscow, Funktsional'nyy Analiz i Yego Prilozheniya, Vol 7, vyp 3, Jul-Sep 73,
pp 75-76

Abstract: The article states the following theorem, together with certain corollaries: Every finite-multiple kernel of a function at a critical point either is 0-modal and reduces to one of the normal forms A, D, E, or belongs to one of the following classes:

The letters here designate classes of kernels which are stably equivalent. The indicated polynomials of degree k define sufficient k-streams. The superscript is the codimension of a class; the subscript (if it is a single one), the multiplicity μ . The arrows designate adjoining elements: in any neighborhood of each point of a set of k-streams from a given class there are the points of all the classes to which the arrows lead from the given class (and of some other classes; not all the adjoining elements are indicated).

The author thanks A. M. GABRIELOV, S. M., HUSEYN-ZADEH and J. MILNOR for useful discussions, and dedicates the article to I. M. GEL'FAND on his sixtieth birthday.

"Solubility of Gases in Eutectic Sodium-Potassium Alloy"

Moscow, Atomnaya Energiya, Vol 28, No 1, Jan 70, pp 18-22

Abstract: The article describes results of the measurement of the solubility of gases in the eutectic sodium-potassium alloy at various temperatures. The apparatus used by the authors, in contrast to the device used by E. COMPERE and J. SAVOLAINEN, permits study of the equilibrium between gas and alloy in direct contact with each other. This made it possible to measure the solubility not only of hydrogen, but also of such gases as nitrogen, argon, and helium. In addition, information could be obtained on the kinetics of the interaction of the gases with the alloy. The hot volume method was used to study the solubility of the gases in the alloy.

The first series of experiments yielded the dependence of the hydrogen pressure on the amount of hydrogen absorbed by the alloy

pp 18-22

at 380° C. The dependence of activity coefficient, γ , of hydrogen in the alloy on the hydrogen concentration was calculated. In the second series of experiments, undertaken following removal of hydrogen from the alloy by evacuation, the temperature dependence of the saturation concentration of hydrogen in the alloy was calculated, as well as the temperature dependence of the dissociation pressure of the saturated hydrogen solution.

Some results are described of the kinetic study of the interaction of gases with alloy. The process of hydrogen evolution, as well as the process of absorption, is described by a first-order reaction equation. The solubility of the inert gases was determined for the alloy at 300° C. The absorption rate of the inert gases is much slower than hydrogen absorption.

"Activation Control of Oxygen in Circulating Sodium-Potassium Coolant Using
a Neutron Generator"

Tr. VNII radiats. tekhn. (Works of the All-Union Scientific Research Institute of Radiation Engineering), 1972, No. 7, pp 137-144 (from RZh-50. Yadernyye reaktory, No 11, Nov 72, Abstract No 11.50.93)

Translation: The first stage in carrying out continuous control of oxygen in a circulating loop with an Na-K alloy and a mockup of a nuclear reactor circuit is described. The basis of the method is the familiar reaction for determining oxygen on the basis of N¹⁶ (the reaction O¹⁶ (n, p) N¹⁶). A small-scale neutron generator of the type NGI-5 with a flux of about 5·10⁸ neutron/sec was used for activation. This method for oxygen control on the basis of the N¹⁶ isotope is also applicable in the active loop of a nuclear reactor.
